BIX-FW2 Advanced electronic Pregnant Women Examination manikin

The healthy birth of a baby is inseparable from strict and detailed prenatal examination of pregnant women. Prenatal examination of pregnant women is very important to the future of the baby. Our company designed this model based on the fact that pregnant women must master various standardized examination steps during prenatal examination. The model is designed and manufactured according to the body size of standard pregnant women. It is made of imported thermoplastic elastomer plastic material. Its appearance and touch are similar to the human body. It is realistic and gives interns a real clinical environment experience. It is the most ideal teaching aid for clinical practice training of obstetrics and gynecology medical staff in various medical schools, health schools, nursing schools, hospitals, etc.

Product main functions:

- 1.This model can be used for practice and guidance of four-segment palpation, auscultation of fetal heart sounds, external pelvic measurement and breast care;
2. In order to simplify the use and management, air can be injected into the uterus through the external rubber ball, and the adjustment of the inflation can make it the closest to the human body;
3. The bones needed for abdominal measurements and pelvic measurements are already formed internally. Therefore, when palpating, you can get a sensation that is very similar to that of a real person's body;
- 4.Practice listening to fetal heart sounds with a wooden earpiece or stethoscope.
